Project no. 4 – Creating responsive websites

Hubert Bęczkowski, ID: 307290

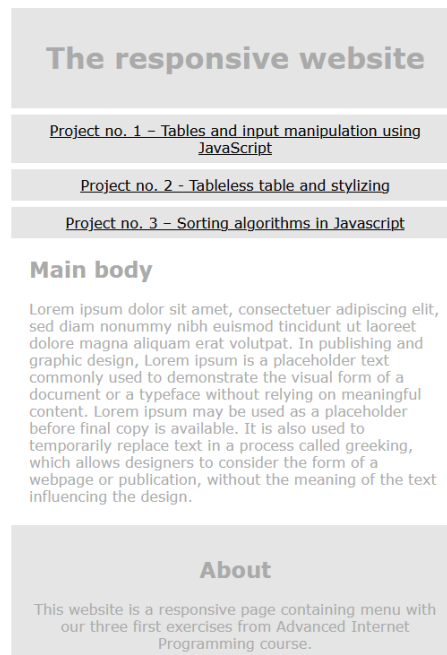

Given task

- Create a responsive website which contains the contents of three first exercises
 - The links to the exercises are placed in the left side of the page
 - There is also main body and about part on the page

The responsive webpage

As the name suggests, the page is responsive, thanks to which it reacts to however the user resizes the window:

The resize capability of created page

The project pages are linked, and also provided in the files that are sent as PO4. The routes are relative, and in order for it to work, the files must not be placed anywhere else, due to the fact, that the code is not placed on any website but exists as a HTML file only.

Exercise itself seemed hard in beginning, but after fiddling with it for a while I managed to get a grip on the concept, and understand how responsive creation of website works. Overall, I have learned how to create a clean and proper page, that responds to users actions.
